

JavaScript Functions — Practice Set

Beginner → Intermediate → Higher Order Functions | 25 Questions

▣ Level 1 — Function Basics

Q1. Simple Function

``greet()`` naam ka function banao jo:

Hello Kartik

print kare.

Q2. Function with Parameter

``greet(name)`` function banao jo given name ke saath greeting print kare.

Example: `greet("Kartik")` → Hello Kartik

Q3. Add Two Numbers

``add(a, b)`` function banao jo dono numbers ka sum return kare.

Example: `add(10, 20)` → 30

⚠ ``console.log()`` ke andar calculation mat karna. ``return`` use karna hai.

Q4. Square

``square(n)`` function banao jo number ka square return kare.

Example: `square(5)` → 25

Q5. Even or Odd

``checkEvenOdd(n)`` function banao.

`checkEvenOdd(7)` → Odd

`checkEvenOdd(8)` → Even

▣ Level 2 — Return Strong Karo

Q6. Maximum of Two

``max(a, b)`` function banao jo dono me se larger number return kare.

Example: `max(10, 25)` → 25

Q7. Positive / Negative / Zero

``checkNumber(n)`` function banao.

`checkNumber(10)` → Positive

`checkNumber(-5)` → Negative

`checkNumber(0)` → Zero

Q8. Sum 1 to N

``sumN(n)`` function banao jo 1 se n tak ke numbers ka sum return kare.

Example: `sumN(5)` → 15

Internally loop use karna hai.

Q9. Count Even Numbers

``countEven(n)`` function banao jo ``1`` se ``n`` tak ke even numbers ki count return kare.

Example: `countEven(10)` → 5

Q10. Factorial

``factorial(n)`` function banao.

Example: `factorial(5)` → 120

▣ Level 3 — Functions + Loops

Q11. Reverse a Number

`reverseNumber(12345)` → 54321

⚠ String conversion prohibited.

Q12. Sum of Digits

`sumDigits(5832)` → 18

Q13. Count Digits

`countDigits(58321)` → 5

Q14. Prime Checker ▣

``isPrime(n)`` function banao jo prime number ke liye true aur otherwise false return kare.

`isPrime(17)` → true

`isPrime(18)` → false

Q15. Perfect Number

``isPerfect(n)`` function banao jo perfect number ke liye true aur otherwise false return kare.

`isPerfect(6)` → true

`isPerfect(10)` → false

Remember: $1 + 2 + 3 = 6$

▣ Level 4 — Functions + Arrays

Q16. Array Sum

``sumArray([10, 20, 30, 40])`` ka result 100 hona chahiye.

Function banao aur sum return karo.

Q17. Largest Element

``findMax([10, 45, 2, 89, 34])`` → 89`

⚠ ``Math.max()`` use nahi karna.

Q18. Count Even Elements

``countEven([1, 2, 4, 7, 8, 11])`` → 3`

Q19. Reverse an Array

``reverseArray([1, 2, 3, 4, 5])`` → [5, 4, 3, 2, 1]`

Original array ko modify karna hai ya new array return karna hai — tum khud decide karo.

Q20. Find Element

``findElement([10, 20, 30, 40], 30) → true``

``findElement([10, 20, 30, 40], 50) → false``

▢ Level 5 — Functions + Array Methods

Q21. Get Even Numbers

``getEven([1,2,3,4,5,6]) → [2,4,6]``

Hint nahi. Decide yourself: ``map`` / ``filter`` / loop?

Q22. Get Squares

``getSquares([1,2,3,4,5]) → [1,4,9,16,25]``

Q23. Sum of Even Numbers

``sumEven([1,2,3,4,5,6]) → 12``

Because: $2 + 4 + 6 = 12$

Yahan ek se zyada concepts combine honge.

Q24. Find First Number Greater Than 50

``findGreater([10, 25, 63, 72, 90]) → 63``

Q25. HOF Challenge 💀

Function banao: ``calculate(a, b, operation)``

Jo ``operation`` ke according result return kare.

Example:

`calculate(10, 5, add) → 15`

`calculate(10, 5, multiply) → 50`

Tumhe ``add()`` aur ``multiply()`` functions bhi banane hain. Ye HOF ka actual practical use hai.
