

JavaScript Arrays

Fundamentals Practice Set • 15 Questions • Easy → Hard

□ Level 1 — Basics

Q1. Create & Access

Ek array banao jisme 5 numbers ho. Array ko print karo, uski length print karo, aur first aur last element print karo.

Hint: length aur indexing use karo. Last element ke liye length - 1 socho.

Q2. Update an Element

Given array:

```
let arr = [10, 20, 30, 40, 50];
```

`20` ko `25` se replace karo aur updated array print karo.

Hint: Indexing se directly value update kar sakte ho.

Q3. Access Specific Elements

Given array:

```
let arr = [10, 20, 30, 40, 50];
```

Index `0`, `2` aur `4` ke elements print karo.

Hint: Direct indexing.

Q4. First + Last

Given array ke first aur last elements ka sum print karo.

Hint: Last element ke liye arr.length - 1 use karo.

Q5. Array Check

Given array check karo ki usme `JavaScript` present hai ya nahi.

Hint: includes() use karo aur result ke according `Found` / `Not Found` print karo.

□ Level 2 — Adding & Removing

Q6. Add Elements

Given:

```
let fruits = ["Apple", "Banana", "Orange"];
```

End me `Mango` aur `Grapes` add karo aur updated array print karo.

Hint: push().

Q7. Remove & Print

Given array se last element remove karo aur removed element + updated array dono print karo.

Hint: `pop()` kya return karta hai, observe karo.

Q8. Beginning Manipulation

Given:

```
let names = ["Rahul", "Aman", "Rohit"];
```

Beginning me `"Kartik"` add karo, phir first element remove karo. Final array print karo.

Hint: `unshift()` + `shift()`.

Q9. Conditional Addition

Given numbers array me `100` tabhi add karo jab `100` already present na ho.

Hint: `includes()` + `if` + `push()`.

Q10. Array Length Tracking

Given array ki initial length print karo. Usme 2 elements add karo, phir ek element remove karo aur final length print karo.

Hint: Har operation ke baad length observe karo.

□ Level 3 — `slice()` / `splice()`

Q11. Extract Without Modifying

Given:

```
let arr = [10, 20, 30, 40, 50];
```

`slice()` ka use karke `[20, 30, 40]` create karo aur check karo ki original array change hua ya nahi.

Goal: `slice()` ka non-mutating behavior samajhna.

Q12. Remove Specific Elements

Given:

```
let arr = [10, 20, 30, 40, 50];
```

`splice()` ka use karke `30` aur `40` remove karo.

Goal: `splice(start, deleteCount)` properly understand karna.

Q13. Replace Using splice() 📄

Given:

```
let arr = ["HTML", "CSS", "Python", "Java"];
```

`"Python"` ko `"JavaScript"` se replace karo using splice().

Hint: Ek element delete karna hai aur usi position par ek new element insert karna hai.

📄 Level 4 — Mixed Fundamentals

Q14. Array Transformation

Given:

```
let arr = [10, 20, 30, 40, 50];
```

Final array exactly ye hona chahiye:

```
[5, 10, 20, 30, 40]
```

Hint: Ek element remove karna hai aur beginning me ek new element add karna hai. pop() + unshift() try karo.

Q15. 📄 Array Fundamentals Challenge

Given:

```
let arr = ["HTML", "CSS", "Python", "Java", "C++"];
```

Program likho jo:

1. Array ki initial length print kare.
2. `"Python"` ko `"JavaScript"` se replace kare.
3. Beginning me `"Git"` add kare.
4. Last element remove kare.
5. Check kare ki `"JavaScript"` array me present hai ya nahi.
6. Final array aur final length print kare.

Rule: Is question ko khud decide karke solve karna hai ki kis step par kaunsa array operation use hoga. 😊
